

**New site in 15 minutes****AdultWebware v4.0 tutorial**

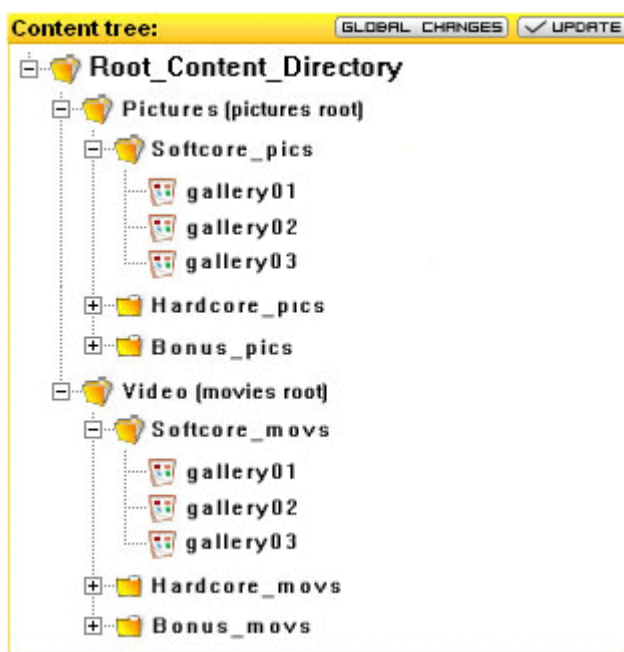

This tutorial shows how easy it is to set up a new website in 15 minutes (if you already have your content categorized). As soon as your AdultWebware is installed, you may want to try the following:

**Structurize your content using MS Explorer**

Make the needed directories tree as you want to see it (starting with pictures/ and videos/, for example, to divide content into pictures and videos). You can create as many galleries and subgalleries as you need to. Gallery is a directory where the content files are located. Therefore, try not to place any files in the middle directories. To know more about content structurizing, refer to the corresponding tutorial.

**Upload your content to server**

Upload content files into each appropriate gallery directory. For uploading files you can use any FTP client (FlashFXP is recommended, [www.flashfxp.com](http://www.flashfxp.com)). After everything is uploaded, you will have something like this in the galleries menu:

## Make your changes visible

After uploading all content, all you need is to let the script recognize the changes you have made. To make this - change your content files access rights to 777 (Write-Write-Write). It is as easy as pressing right button on your mouse in FlashFXP on your main content/ directory and making a recursive CHMOD. Or, you can make it even faster via your SSH (shell) access:

```
chmod -R 777 content
```

(where "content" is your main content directory)

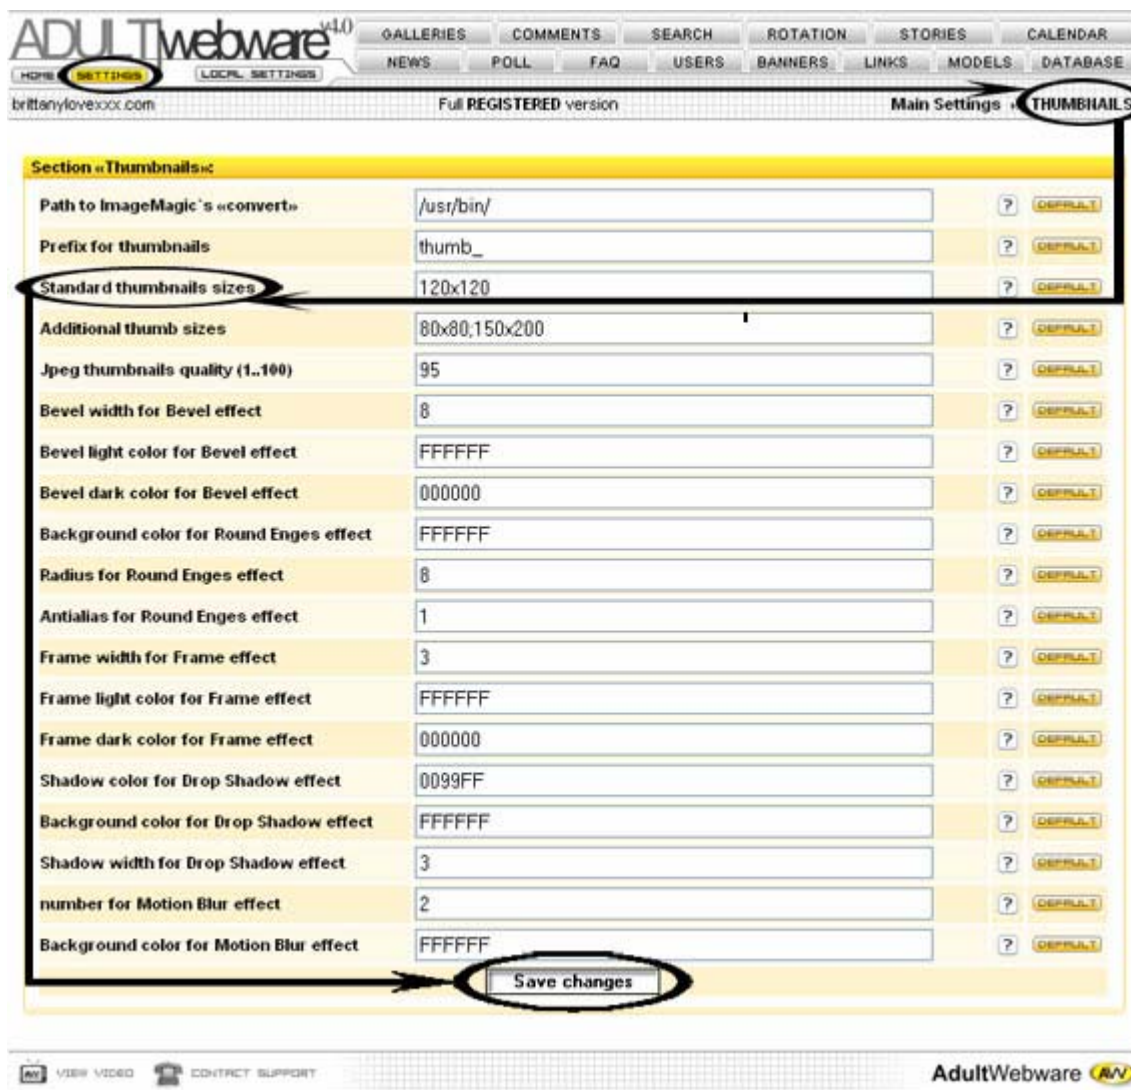

Then, in your Admin Panel (/awpanel --> Galleries) click "update index" button.

This simple move will make your content changes available to users. Repeat step 3 each time you make any content changes. Just try it once and you will be surprised how really easy it is.

## Set the standard thumbnails sizes

You can set the standard thumbnails sizes if you will go to "Main Settings", then "Thumbnails" and fill the area "Standard thumbnails sizes"

AdultWebware AWV

**a)** you can specify 1 side of the thumbnail (the bigger one) dimension only and the other side (the smaller one) will be calculated proportionally. For example, you enter "90" (without quotes), in that case if an image is vertically-oriented, you will have a thumbnail with height=90, and with proportional calculated width. If an image is horizontally-oriented, you will have a thumbnail with width=90 and with proportional calculated height.

**b)** you can create thumbnails with exactly specified width/height (for example, to suite a specific design layout) using an "x" separator. For example, if you set 90x90, the script will crop the bottom side if image is vertical-oriented and the right side if it is horizontal-oriented. You can specify a centering option if you want to have centered thumbnails. To make so, you should use syntax like this: 90x90x1 and the script will crop all sides of the image (x1 suffix for thumbnail size means centered cropping).

### Choose Pictures Root Directory and Movies Root Directory

The next step is choosing your pictures and movies root directories. You can do it in the "Galleries" menu.

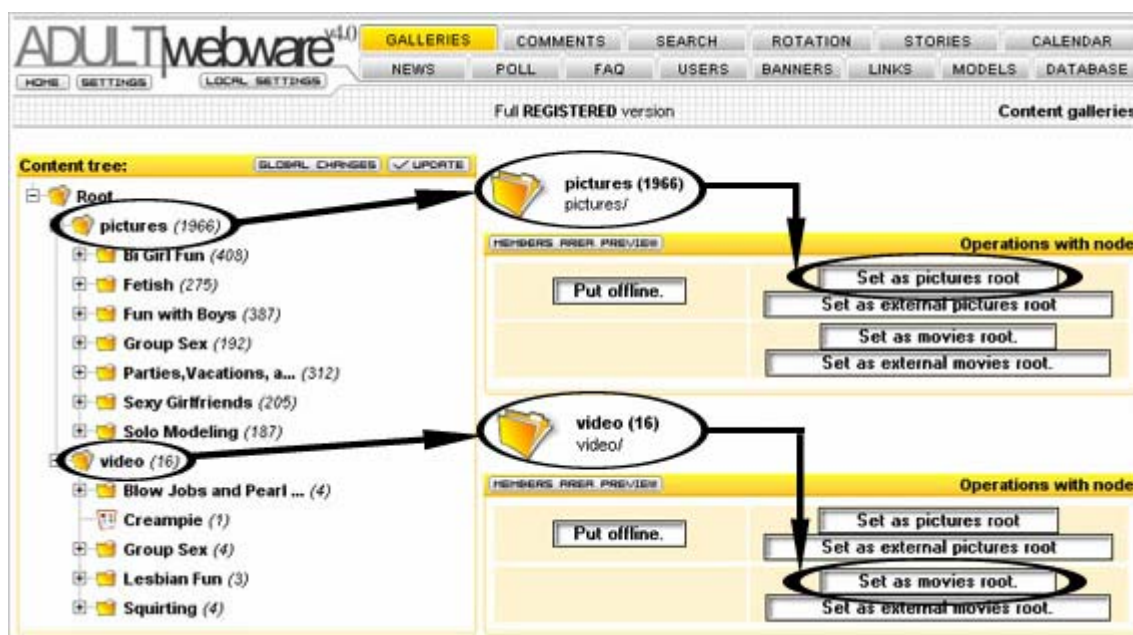

**a)** Choosing the Pictures Root:

Let it be content\_directory/pictures/. Click on the folder "pictures" and you'll see the menu "Operations with node". Then click on the "Set as picture root" button to choose the current directory "pictures" as a "Pictures Root"

**b)** Choosing the Movies Root:

Let it be content\_directory/video/. Click on the folder "video" and you'll see the menu "Operations with node". Then click on the "Set as movies root" button to choose the current directory "video" as a "Movies Root"

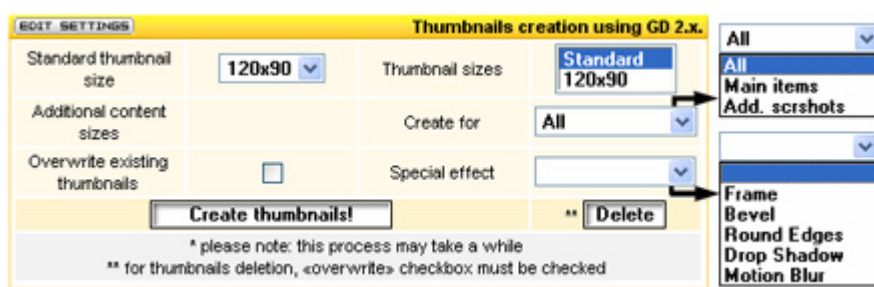

## Create thumbnails

You can create thumbnails using GD 2.x or ImageMagic depend on what is installed on your server, but the menu and process is the same for both of them. You can create thumbnails for 1 gallery or for 1 category or for all galleries at once.

To create thumbnails for all galleries at once select the "Picture Root" (the folder content\_directory/pictures/ in our example) and you'll see the "Thumbnail creation using GD 2.x" menu:

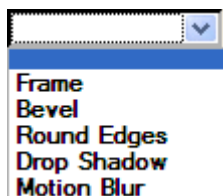

a) "Standard thumbnail size" - here you see the list of standard thumbnail sizes (if you cant see it - see item 4), you have to choose one of them.

b) "Thumbnail sizes" - select "Standard"

**c)** "Create for" - select "All" or "Main items" to create thumbnails for your content for the first time

**d)** "Special effect" - if you want, you may choose any preferred thumbnails effect from the list:

No effect

Bevel

Round edges

Frame

Drop shadow

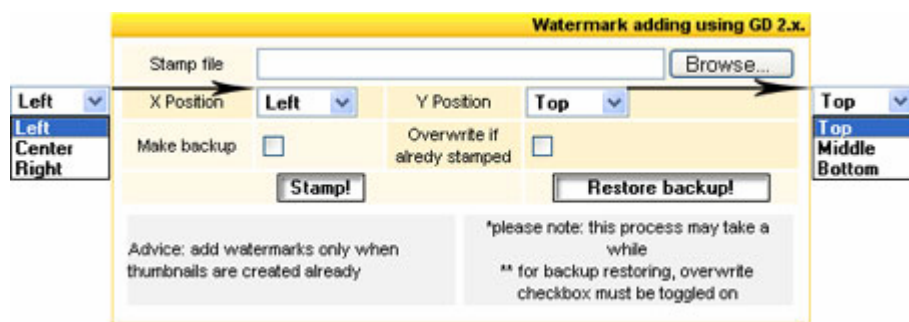

Motion Blur

**e)** press the "Create Thumbnails" button - Thumbnails will be created with a "thumb\_" prefix added to each image filename. You can change the prefix along with all other thumbnail settings in your Admin Panel --> Settings --> Thumbnails, you can just click the button "Edit settings" in the "Thumbnails creation" menu to get there (scr. in the item 4)

## Add watermarks

We advise you to add watermarks only when thumbnails are created already!

**a)** to create copyright stamps enter Admin Panel, then Galleries section. On the page bottom you will find the "Watermark" division.

**b)** input path to the your stamp file in the "Stamp file" field using the "Browse" button.

c) to add watermarks safely we advise you to create backup of your images first, to do it check the "Make Backup" box (the copy of each image will be stored with a .bak extension).

d) choose the position of your watermark on the image - to choose the horizontal position select "Left", "Center" or "Right" in the "X Position" menu; to choose the vertical one select "Top", "Middle" or "Bottom" in the "Y position" menu. Doing this you can choose 1 of 9 positions of you watermark on the image.

e) press the "Stamp!" button.

### Add galleries/categories descriptions, keywords and facing thumbnails

You can add Galleries (Categories) Descriptions and Galleries (Categories) Keywords in the "Editing category" division of the "Galleries" menu of the "Admin Panel". Descriptions and keywords can be added to each category and gallery.

Assigned models

Assigned Banner Group

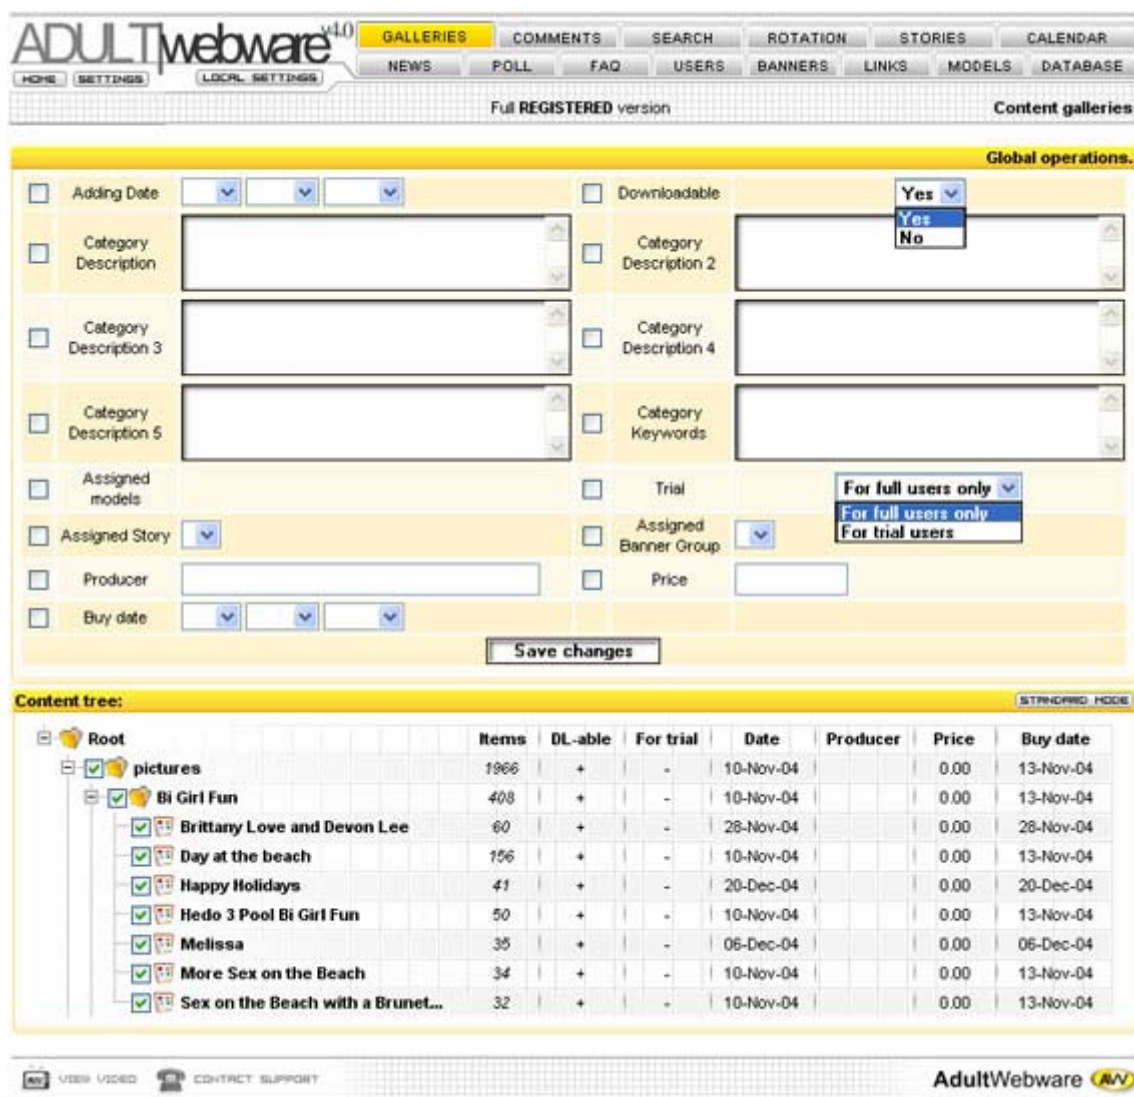

**a)** write your description in the "Category Description" field. As you can see there can be several "Category Description" fields. Each of them can be displayed in different places depend on your template settings (to change this settings contact the AW support).

**b)** write the keywords describing your gallery (category) in the "Category Keywords" field.

**c)** select gallery (category) thumbnail - click "Select Thumbnail", choose the thumbnail you want to be the the category thumbnail and click on it, you will see its ID in the "Category Thumbnail" field.

## Global changes mode

If you have more than one galleries with same keywords, description or any other fields common information, you can edit these galleries as one in the global changes mode. Fast and easily make necessary changes to multiple elements at once. Convenient view for visual comparison.
